

## Chapter 1: Limit Points and Sequences

- **Point:** element of the real numbers
- **Point Set:** collection of points
- **Linearly Ordered:** if  $a, b, c \in M$ , then
  - if  $a < b$  and  $b < c$ , then  $a < c$  and
  - only one of the following is true
    - \*  $a < b$
    - \*  $b < a$  or
    - \*  $a = b$
- $\mathbb{R}$  is linearly ordered
- If  $p$  is a point, there is a point less than  $p$  and greater than  $p$
- If  $p$  and  $q$  are two points, there is a point between them (e.g.  $(p+q)/2$ )
  - 'Two points' implies that they are not the same point
- If  $a < b$  and  $c$  is a point, then  $a+c < b+c$
- If  $a < b$  and  $c > 0$ , then  $a \cdot c < b \cdot c$ . If  $c < 0$  then  $a \cdot c > b \cdot c$
- If  $x$  is a point, then  $x$  is an integer, or  $\exists$  an integer  $n$  s.t.  $n < x < n + 1$
- **Open Interval:** If  $O$  is an open interval, then  $O$  is the set containing all points between two points  $a$  and  $b$ . Denoted  $(a,b)$ .
- **Closed Interval:** If  $C$  is an open interval, then  $C$  is the set containing all points between two points  $a$  and  $b$ , and  $a$  and  $b$  themselves. Denoted  $[a,b]$ .
- **Limit Point:** If  $M$  is a point set and  $p$  is a point, then  $p$  is a limit point of  $M$  if *every* open interval containing  $p$  contains a point in  $M$  different from  $p$ .

### Problem 1

Show that if  $M$  is the open interval  $(a,b)$ , and  $p$  is in  $M$ , then  $p$  is a limit point of  $M$ .

*Proof.* To show that  $p$  is a limit point of  $M$ , we need to show that if we have an open interval containing  $p$ , we also have a different point  $p$  in the interval that is also in  $M$ . If we construct a new open interval  $(c,d)$  that contains  $p$ , we need to show that the new interval also contains another point from  $M$ . We can choose this point to be  $(p+x)/2$ , where  $x = \min(b,d)$ . We

know that this point is also in  $M$ , because it is greater than  $p$  (which is in  $M$ ), but less than the highest point in  $M$ . Therefore we have found a point in the same interval that is not  $p$ .  $\square$

## Problem 2

**Show that if  $M$  is the closed interval  $[a,b]$  and  $p$  is not in  $M$ , then  $p$  is not a limit point of  $M$ .**

*Proof.* Since  $p$  is not in  $M$ , it is not between or equal to  $a$  and  $b$ , and therefore any interval that contains  $p$  is not within  $M$ .  $\square$

## Problem 3

**Show that if  $M$  is a point set having a limit point, then  $M$  contains 2 points. Must  $M$  contain 3 points? 4 points?**

*Proof.*  $\square$
